3

## Agenda

7/12/2023

pra-sâmi

4

## Acknowledgement...

Geoffrey Everest Hinton CC FRS FRSC

- ❑ is an English Canadian cognitive psychologist and computer scientist, most noted for his work on artificial neural networks.
- ❑ Since 2013, he divides his time working for Google (Google Brain) and the University of Toronto. In 2017, he cofounded and became the Chief Scientific Advisor of the Vector Institute in Toronto.
- ❑ With David Rumelhart and Ronald J. Williams, Hinton was co-author of a highly cited paper published in 1986 that popularized the backpropagation algorithm for training multi-layer neural networks, although they were not the first to propose the approach.
- ❑ Hinton is viewed as a leading figure in the deep learning community.
- ❑ The dramatic image-recognition milestone of the AlexNet designed in collaboration with his students Alex Krizhevsky and Ilya Sutskever for the ImageNet challenge 2012 was a breakthrough in the field of computer vision.

5

What is Computer Vision...

7/12/2023

*pra-sâmi*

6

Ambulance given green light all through....

7/12/2023

*pra-sâmi*

7

Computer vision is making progress in leaps and bounds...

7/12/2023

*pra-sâmi*

8

Convolutional neural networks (CNN, ConvNet) is a class of deep, feed-forward (not recurrent) artificial neural networks that are applied to analyzing visual imagery.

7/12/2023

*pra-sâmi*

9

## Computer Vision

- ❑ Self driving car
- ❑ Fully automated warehouse and ports
  - ❖ <https://youtu.be/RFV8IkY52iY>
- ❑ Image search services,
- ❑ Unlock phone
- ❑ Provide access to secure area
  - ❖ Open your house
  - ❖ Enter office without your access card
- ❑ Object identification Apps
  - ❖ Garment
  - ❖ Food,
  - ❖ Nature
- ❑ Natural style transfer
- ❑ Automatic video classification systems

7/12/2023

pra-sâmi

10

## Style Transfer

7/12/2023

11

## Style transfer

7/12/2023

pra-sāmi

12

## Style transfer

7/12/2023

pra-sāmi

13

## Computer Vision

- ❑ Have been used in image recognition since the 1980s
- ❑ Increase in computational power, the amount of available training data, CNNs have managed to achieve better performance
- ❑ Rapid advancement
  - ❖ Newer and Newer products and applications are coming up
  - ❖ Some of you will get a chance to directly work on these advance applications
- ❑ The development community is also very kind in sharing their success stories
- ❑ The ideas can be borrowed in other applications:
  - ❖ Voice recognition
  - ❖ Natural language processing (NLP)

7/12/2023

pra-sâmi

14

## Computer Vision

- ❑ What makes vision hard?
- ❑ Vision needs to be robust to a lot of transformations or distortions:
  - ❖ Change in pose/viewpoint
  - ❖ Change in illumination
  - ❖ Deformation
  - ❖ Occlusion (some objects are hidden behind others)
- ❑ Many object categories can vary wildly in appearance (e.g. chairs)

"Imaging a medical database in which the age of the patient sometimes hops to the input dimension which normally codes for weight!" - Geoff Hinton

7/12/2023

pra-sâmi

15

## Why?

- ❑ Enough of sales pitch...
- ❑ Why not simply use a regular deep neural network with fully connected layers?
- ❑ Small (150 x 150 x 3) image has 67,500 pixels
- ❑ If we consider first hidden layer as 1000,
- ❑ First weight matrix  $W^{[1]}$  will be 67,500 x 1000
- ❑ Do your math..... that size is huge

7/12/2023

pra-sâmi

16

## Smaller Network: CNN

- ❑ We know it is good to learn a small model
- ❑ Fully connected model, each hidden unit is processing every input
  - ❖ Do we really need all the edges?
- ❑ Can some of these be shared?

Image courtesy: University of Waterloo.

7/12/2023

pra-sâmi

17

Images are high-dimensional vectors. It would take a huge amount of parameters to characterize the network.

7/12/2023

pra-sâmi

18

### Learning an image...

- ❑ Some patterns are much smaller than the whole image
- ❑ Can represent a small region with fewer parameters

7/12/2023

pra-sâmi

19

## Learning an image...

- ❑ Same pattern appears in different places
  - ❖ Can they be compressed!
- ❑ What about training a lot of such “small” detectors and each detector must “move around”

7/12/2023

pra-sâmi

20

## Learning an image...

7/12/2023

pra-sâmi

21

## Learning an image...

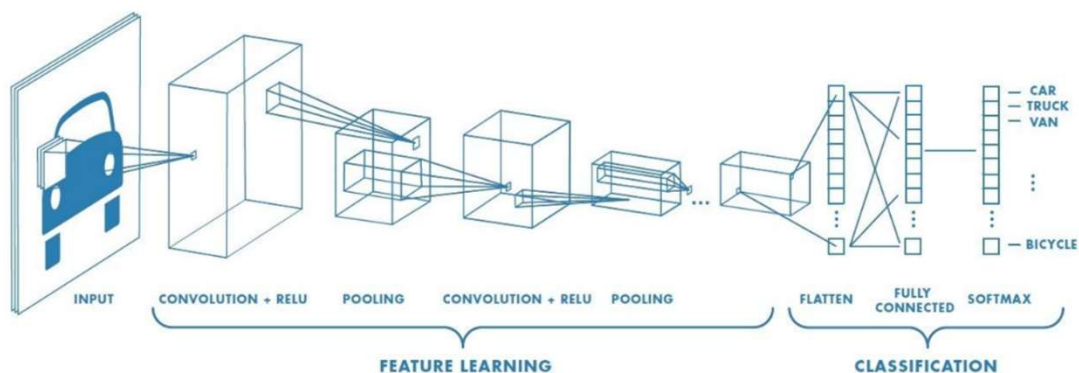

- ❑ The same sorts of features that are useful in analyzing one part of the image will probably be useful for analyzing other parts as well.
  - ❖ E.g., edges, corners, contours, object parts
- ❑ We want a neural net architecture that lets us learn a set of feature detectors that are applied at all image locations
- ❑ So far, we've seen a bunch of types of layers
  - ❖ Fully connected layers (dense)
  - ❖ Embedding layers (i.e. lookup tables)
  - ❖ A few more in RNNs (GRU, LSTMs, etc.)
- ❑ Different layers could be stacked together to build powerful models
- ❑ Let's add another layer type: the convolution layer

7/12/2023

pra-sâmi

22

## Overall Layout

7/12/2023

pra-sâmi

*pra-sâmi*

- ❑ A CNN is a neural network with some convolutional layers
  - ❖ And, of course, a few other layers
- ❑ A convolutional layer has a number of filters that does convolutional operation
  - ❖ Some of the literature would call it Kernel

*pra-sâmi*

27

What does this Convolution Filter/ Kernel do?

 $*$ 

0	1	0
1	4	1
0	1	0

7/12/2023

pra-sâmi

28

What does this Convolution Filter/ Kernel do?

 $*$ 

0	-1	0
-1	8	-1
0	-1	0

7/12/2023

pra-sâmi

29

What does this Convolution Filter/ Kernel do?

 $*$ 

0	-1	0
-1	4	-1

 $*$ 

1	0	-1
2	0	-2
1	0	-1

7/12/2023

pra-sâmi

31

## Convolutional Networks

- ❑ Two kinds of layers:
  - ❖ Detection layers (or convolution layers)
  - ❖ Pooling layers
- ❑ The convolution layer has a set of filters.
  - ❖ Output is a set of feature maps, each one obtained by convolving the image with a filter.

Example first-layer filters

(Zeiler and Fergus, 2013, Visualizing and understanding convolutional networks)

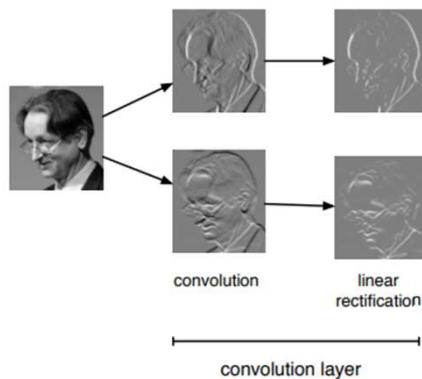

7/12/2023

pra-sâmi

32

## Convolutional Networks

- ❑ It's common to apply a linear rectification (activations) nonlinearity or something else:
  - ❖  $y_i = \text{Relu}(z_i)$ ,  $\text{Tanh}(z_i)$ , etc.

- ❑ Convolution is a linear operation.
- ❑ Therefore, we need a nonlinearity, otherwise 2 convolution layers would be no more powerful than 1
- ❑ Two edges in opposite directions shouldn't cancel
- ❑ Non-linearity makes the gradients sparse, which helps optimization

7/12/

pra-sâmi

33

## Image with a edge

- Convolution is basic building block of image recognition
- Using edge detection as an example in following image...

- Apply filters on the image!

7/12/2023

pra-sâmi

34

## Convolution on 3D images (RGB )

If you are looking for edge in one channel only, make rest of them as zeros.

7/12/2023

pra-sâmi

35

## Convolution on 3D images (RGB )

## Convolution

42

## Convolution

□ How many steps filter can take before it goes out of image?

□  $10 - 3 + 1 = 8$  in either direction...

25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0

7/12/2023

pra-sâmi

43

## Convolution

$$\square 10 - 3 + 1 = 8 \times 8$$

25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0

□ Output will be a 2D Matrix

□ Assuming it moves by one step

□ Given that size of the image is 10 and size of the filter is 3

□ Taking :  $10 - 3 + 1 = 8$  steps

□ Output image will have 8 cells

□ Hence, Output image size  
 $= \{nH_{in} - nF + 1\} \times \{nW_{in} - nF + 1\}$

7/12/2023

pra-sâmi

44

Has it detected the edge?

7/12/2023

pra-sâmi

45

What if we move two steps at a time

7/12/2023

pra-sâmi

46

## Stride

25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0

- ❑ Steps are called stride
- ❑ If we move 2 steps at a time, we can move 4 steps only
- ❑ In other word with stride of 2
  - ❖ Given that size of the image is 10 and size of the filter is 3
- ❑ Output image size will be :  $(10 - 3)/2 + 1 = 4.5$  or 4
- ❑ For fractions pick lower integer
- ❑ Over flow not permitted

7/12/2023

pra-sâmi

47

## Stride

$$\square (10 - 3) / 2 + 1 = 4 \times 4$$

25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0
25	25	25	25	25	0	0	0	0	0

□ Steps are called stride

□ Hence, Output image size =

$$\{ (nH_{in} - nF) / stride + 1 \} \times \{ (nW_{in} - nF) / stride + 1 \}$$

□ If we apply multiple filters → this layer will have 3D matrix.

❖ Each layer corresponding to one filter.

7/12/2023

pra-sâmi

48

## Convolution

□ Apply filters and stack filtered layers together to make a 3D matrix

□ Hence from 3 layer RGB, we can construct as many layers as number of filters applied...

□ Move "stride" steps, generally one or two  
❖ one in most cases...

□ Strongly advisable to keep filters as odd shape (3,3) or (5,5)

□ Two strong reason..

□ We do not want asymmetric padding  
❖ Not good for learning features  
❖ It's better to have central point of the filter

7/12/2023

pra-sâmi

49

## Another image

- This image has a few distinct edges

158	220	252	252	252	170	3	3	3	13	18	18	498	390
158	220	252	252	252	170	3	3	3	13	18	18	498	390
145	220	252	252	233	170	3	3	113	13	18	18	559	390
102	220	252	252	169	170	3	3	203	13	18	18	318	344
3	177	213	213	51	172	182	182	252	142	12	12	-62	24
3	3	98	140	51	51	163	225	252	252	207	131		

7/12/2023

pra-sâmi

53

## Another Convolution

- Single filter convolution:
- Layer R =  $3 + 3 + 102 - 98 - 206 - 252 = -448$
- Layer G =  $51 + 51 + 169 - 163 - 196 - 3 = -91$
- Layer B =  $252 + 252 + 203 - 207 - 10 - 18 = 472$
- Total =  $-448 + -91 + 472 = -67$

- Incoming Image shape =  $(10,10,3) \rightarrow n_{\text{Hin}} = 10$  ;  $n_{\text{Win}} = 10, n_{\text{C}} = 3$
- Filter shape =  $(3, 3, 3) \rightarrow n_{\text{F}} = 3$  ;  $n_{\text{F}} = 3, n_{\text{C}} = 3$
- Stride = 1
- Hence the size will be  $8 \times 8$  after convolution

In convolution,:

- With every convolution image is shrinking
- Corners and edges of image are used less frequently than the middle

7/12/2023

pra-sâmi

54

## Other filters

- We have seen vertical filter... How about horizontal Filter....

- No surprises there....

1	1	1
0	0	0
-1	-1	-1

- The math will be exactly the same and we would get horizontal edge

7/12/2023

pra-sâmi

55

## Horizontal Edge...

7/12/2023

pra-sâmi

56

## Other filters

□ Sobel Filter...

1	0	-1
2	0	-2
1	0	-1

□ There was a lot of debate on filters....

□ Researchers kept trying various numbers...

□ Why not learn these parameters...

$w_1$	$w_4$	$w_7$
$w_2$	$w_5$	$w_8$
$w_3$	$w_6$	$w_9$

7/12/2023

pra-sâmi

57

## Shade Reversal

- ❑ So far we have seen lighter to darker shade filters...
- ❑ What happens if we move from darker shade to lighter

7/12/2023

pra-sâmi

58

## Shade Reversal

- ❑ So far we have seen lighter to darker shade filters...
- ❑ What happens if we move from darker shade to lighter
- ❑ We will again get the edge only it will be negative this time...

7/12/2023

pra-sâmi

59

## Convolving a Volume

- So far we have shown that same filter is applied to all layers
- In theory, it is possible to have a filter which is looking for edges in red channel alone...

$$\begin{bmatrix} 1 & 1 & 1 \\ 0 & 0 & 0 \\ -1 & -1 & -1 \end{bmatrix}$$

$$\begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$$

$$\begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$$

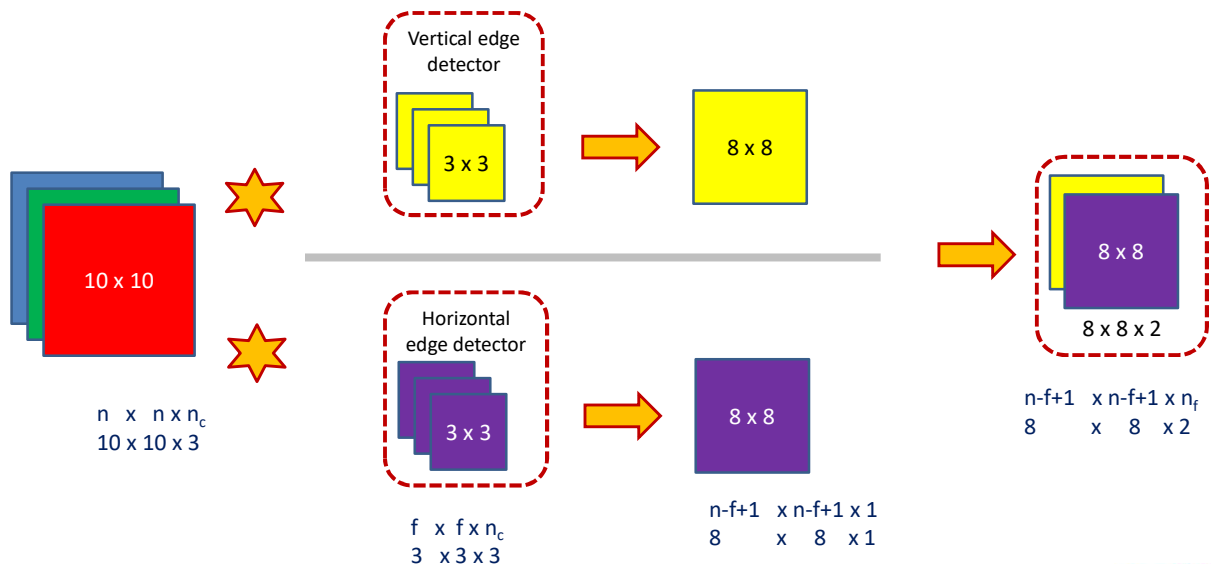

- So far we have been showing that 3D image converts to 2D image when we apply filter
- By applying a number of filters to detect different edges, we can have 3d Convolutional Volumes.

7/12/2023

pra-sâmi

60

## Multiple Filters

7/12/2023

pra-sâmi

61

## Two Issues with the convolution...

- ❑ With every convolution image is shrinking
  - ❖ Knowing that 100s of layer is not uncommon in the architecture
  - ❖ Image can soon become 1px X 1px
- ❑ Corners and edges of image are used less frequently than the middle

7/12/2023

*pra-sâmi*

62

What if we zero pad the image all around... will it help?

7/12/2023

*pra-sâmi*

65

## Convolution after Padding

- ❑ Incoming image shape = ( 10, 10, 3 )
  - ❖ i.e.  $nH_{in} = 10$  ;  $nW_{in} = 10$  ;  $nC = 3$
- ❑ Padding  $p = 1$
- ❑ Padded image shape = ( 12, 12, 3 )
  - ❖ i.e.  $nH_{in} = 12$  ;  $nW_{in} = 12$  ;  $nC = 3$
- ❑ Filter shape = ( 3, 3, 3 )
  - ❖ i.e.  $nF = 3$  ;  $nF = 3$ ,  $nC = 3$
- ❑ Assuming we move "stride" steps at any time
  - ❖ i.e. stride = 1

- ❑ Output image size:

$$= \left\{ \frac{nH_{in} - nF + 2*p}{stride} + 1 \right\}$$

x

$$\left\{ \frac{nW_{in} - nF + 2*p}{stride} + 1 \right\}$$

$$\begin{aligned} \text{❑ Image Size} &= \left\{ \frac{10 - 3 + 2*1}{1} + 1 \right\} \\ &\times \\ &\left\{ \frac{10 - 3 + 2*1}{1} + 1 \right\} \\ &= 10 \times 10 \end{aligned}$$

We are back to original size...

7/12/2023

pra-sâmi

66

## How much to pad???

- ❑ There are two recommended mechanism
- ❑ **Valid** : output is calculated as
 
$$\left\{ \frac{nH_{in} - nF + 2*p}{stride} + 1 \right\} \times \left\{ \frac{nW_{in} - nF + 2*p}{stride} + 1 \right\}$$
- ❑ So for 10 x 10 image a 5 x 5 filter with 1 px padding, image size will be 8 x 8
- ❑ **Same** : do the padding in such a way so that resultant image is of same size
 
$$\left\{ \frac{nH_{in} - nF + 2*p}{stride} + 1 \right\} \times \left\{ \frac{nW_{in} - nF + 2*p}{stride} + 1 \right\} = nH_{in} \times nW_{in}$$
  - ❖ or  $p = (nF - 1)/2$  for stride = 1

7/12/2023

pra-sâmi

67

## How much to pad???

- ❑ With  $p = (nF - 1)/2$  for stride = 1;
- ❑ We want  $p$  to be an integer and hence
  - ❖ Need  $nF$  to be odd
- ❑ For even value of  $nF$  we would end up in asymmetric padding.
- ❑ Unless we feel one edge of the image is more important than other, there is no need to have asymmetric padding

7/12/2023

*pra-sâmi*

68

## Cross-Correlation vs. Convolution

7/12/2023

*pra-sâmi*

69

## Cross-Correlation vs. Convolution

- ❑ In Signal Theory and Maths
- ❑ Convolution involves multiplying the filter after mirroring on both axis
- ❑ i.e. for filter  $\begin{bmatrix} 3 & 4 & 5 \\ 1 & 0 & 2 \\ -1 & 9 & 7 \end{bmatrix}$
- ❑ It will be mirrored along both axis...  $\begin{bmatrix} 7 & 9 & -1 \\ 2 & 0 & 1 \\ 5 & 4 & 3 \end{bmatrix}$
- ❑ Then we do element wise multiplication.
- ❑ Signal Engineers will agree with me... 😊
- ❑ Such correlations have properties like associative  $(a*b)*c = a*(b*c)$  and all other properties

7/12/2023

pra-sâmi

70

## Cross-Correlation vs. Convolution

- ❑ So that we are correct semantically...
- ❑ What we are doing is called Cross-Correlation....
- ❑ However, Data Scientists across the world have been using filters without reversing it and still call it Convolution...

Now you know... don't write home about it... 😊

77

## One Layer of Conv Net

78

## How Many Parameters...

- ❑ Imagine using 10 filters in a layer, how many parameters in the layer
- ❑ Each filter is 3 x 3 x 3 + a bias = 28 parameters
- ❑ For 10 filters = total 280 parameters
- ❑ Hence, irrespective of size of input image /activation, we still have 280 filters learning what we need to know.... Yay!!!!
- ❑ Helps in prevention of over-fitting

7/12/2023

pra-sâmi

79

## Let's Look at the Dimensions...

$f^{[l]}$ :	Filter Size	Input:	$n^{[l-1]}_H \times n^{[l-1]}_W \times n^{[l-1]}_c$
$p^{[l]}$ :	Padding size	Output:	$n^{[l]}_H \times n^{[l]}_W \times n^{[l]}_c$
$s^{[l]}$ :	Stride	$n^{[l]}_H$ :	$(n^{[l-1]}_H + 2 p^{[l]} - f^{[l]}) / s^{[l]} + 1$
$n^{[l]}_c$ :	Number of filters	$n^{[l]}_W$ :	$(n^{[l-1]}_W + 2 p^{[l]} - f^{[l]}) / s^{[l]} + 1$
Filter size:	$f^{[l]} \times f^{[l]} \times n^{[l-1]}_c$	Activations $a^{[l]}$ :	$n^{[l]}_H \times n^{[l]}_W \times n^{[l]}_c$
Weights (all filters):	$f^{[l]} \times f^{[l]} \times n^{[l-1]}_c \times n^{[l]}_c$	Biases:	$n^{[l]}_c$

Weights are tensors of rank 4

Activation for all  $m$  training examples  $m$  $m \times n^{[l]}_H \times n^{[l]}_W \times n^{[l]}_c$ 

Don't be surprised if you see Filter number first

- ❑ Input size = 8,8,1; pool = 2; Stride = 2
- ❑ After pooling = 4,4,1
- ❑ Formula for size are still applicable,
- ❑ Its independently done on each channels
- ❑ Other option is to use Average instead of Max
  - ❖ But not used frequently.

## Pooling

- ❑ Image Size = 10,10,3; filter Size = 3,3,3; stride = 1
- ❑ After Convolution = 8, 8, 1

- ❑ Input size = 8,8,1; pool = 2; Stride = 2
- ❑ After pooling = 4,4,1
- ❑ Formula for size are still applicable,
- ❑ Its independently done on each channels
- ❑ Other is Average as expected but not used

**Consider that each area represents presence of some feature in the image and high number represents, presence of that feature...**

**It has three (mode, pool and stride) hyperparameters to tune...**

**but no parameters to learn...**

**Gradient descent is not going to do anything here.... 😊**
